

PERVIOUS CONCRETE OWNERS

Stop moss growth now.

Environmentally safe. Quickly effective.

Prevent costly deep-cleaning costs.

Is your pervious concrete turning green? Stop moss growth now, before it gets too thick. Do it yourself by applying a light dusting of sodium bicarbonate (baking soda) wherever green moss is visible. This kills moss within hours and often keeps your pavement moss-free the entire winter. Don't wait until it is so thick that it requires removal by pressure washing. If you do prefer professional pavement cleaning, please contact us.

Use a spreader to apply a very light coating of baking soda directly on moss growth using a spreader.

Treating moss-prone areas as soon as growth is detected reduces volume and the need for heavy duty cleaning.

If you prefer professional maintenance of your pervious pavements, contact us today and we can refer you to a team with the right equipment and experience to keep your pavements looking and draining great year-round.

If pressure washing of your pervious concrete is necessary - please contact us.
